

Project Design Phase

Proposed Solution

Date	20 July 2026
Team ID	
Project Name	Plugging Into the Future: An Exploration of Electricity Consumption Patterns
Maximum Marks	2 Marks

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Electricity consumption data across Indian states is scattered, inconsistent, and difficult to interpret, making it hard to compare regions or identify trends.
2.	Idea / Solution description	Clean and structure the data in SQL Server, build aggregation queries, create interactive Tableau dashboards, and present them through a Flask web application.
3.	Novelty / Uniqueness	Combines a full pipeline — database cleaning, SQL aggregation, Tableau visualization, and web delivery — into one cohesive, modular system rather than a single static report.
4.	Social Impact / Customer Satisfaction	Makes state-level electricity consumption insights accessible to planners, researchers, and the public without requiring technical tools.
5.	Business Model (Revenue Model)	Not applicable — this is an analytical/educational project rather than a commercial product.
6.	Scalability of the Solution	New datasets, years, or states can be added to the SQL Server tables and reflected in the dashboards without redesigning the pipeline.
